Submitted (DEC-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Prevents misfolding and promotes the refolding and
proper assembly of unfolded polypeptides generated under stress
conditions (By similarity).

Gene structure and transcriptional regulation specific to the groBSL operon from the psychrophilic bacterium Colwellia maris.";
Arch. Microbiol. 180:272-278(2003)
-: FUNCTION: Prevents misfolding and promotes the refolding and proper assembly of unfolded polypeptides generated under stress conditions (By similarity).
-: SUBUNIT: Oligomer of 14 subunits composed of two stacked rings of 7 subunits (By similarity).
-: SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-: SIMILARITY: Belongs to the chaperonin (HSP60) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       73 MRNIEARGLKOMKROGDANVKGEEGIVKAHLLIGVHDDIVSMEYDLAYKLGDLHP----

"Complete genome sequence of the methanogenic archaeon, Methanococcus
                                                                                                                                                                                               Science 273:1058-1073(1996).
-!- CATALYTIC ACTIVITY: ATP + L-alanine + tRNA(Ala) = AMP +
diphosphate + L-alanyl-tRNA(Ala).
-!- SUBCELJULAR LOCATION: Cytoplasmic.
-!- SUBCELJULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.

Biol. Chem. 267:4592-4599(1992).
-!- CATALYTIC ACTIVITY: ATP + L-isoleucine + tRNA(Ile) = AMP +
diphosphate + L-isoleucyl-tRNA(Ile).
-!- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=92165815; PubMed=1371507; Scark C., Martindale D.W.; "Isoleucyl-tRNA syntherse from the ciliated protozoan Tetrahymena thermophila. -!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to class-!! aminoacyl-tRNA synthetase family.
-!- FNA Synthetase alpha chain subfamily 1.
-!- CAUTION: Lacks the conserved glutamate residue that binds
Aminoacyl-tRNA synthetase; Protein biosynthesis; Ligase; ATP-binding.
